EX PARTE

Ms. Magalie Roman Salas Secretary Federal Communications Commission 1919 M Street, NW, Room 222 Washington, D.C. 20554

RECEIVED

APR 1 5 1900

FEDERAL COMMUNICATIONS COMMISSION OFFICE OF THE SECRETARY

Re: CC Docket No. 97-208. CC Docket No. 97-231. CC Docket No. 97-121. CC Docket No. 97-137. CC Docket No. 96-98, and RM-9101

Dear Ms. Salas:

This is to inform you that Sid Boren. Randy New. Bill Stacy. Allan Price. Jim Llewellyn. Al Varner. Robert Blau. and the undersigned. all of BellSouth Corporation. and Erwin Krasnow of Verner. Lipfert. Bernhard. McPherson & Hand. met with Commission staff on April 14. 1998. The following Common Carrier Bureau staff members attended some or all of this meeting: Michael Pryor: Jonathan Askin: Patrick Forster: Radhika Karmarkar: Michael Kende: David Kirschner: Wendy Lader: Brent Olson: Les Selzer: Gayle Teicher: Joe Welch: and Audrey Wright. Michael Riordan. the Commission's Chief Economist. also attended the meeting.

During the meeting the participants discussed the performance measurements and reports that BellSouth proposed to create and data it proposes to maintain to demonstrate that BellSouth is providing nondiscriminatory access to unbundled network elements including OSS. BellSouth gave the staff copies of attached document 1 that reflects the performance measurements it has developed to demonstrate compliance with checklist item #2. Meeting participants also discussed the evidence required to demonstrate that an applicant for interLATA relief has satisfied Section 271(c)(1)(A), checklist items #10 (access to databases and associated signaling) and #11 (provision of local number portability).

Attachment 2 is composed of copies of documents previously submitted to the staff and subsequently modified to reflect the discussions BellSouth has had with the staff concerning BellSouth's efforts to demonstrate compliance with checklist items # 1, 6, 7, and 13.

Because the Commission is considering one or more of the issues discussed at the meeting in each of the proceedings identified above, we are filing notice of this exparte meeting in each of those proceedings.

As required by Section 1.1206(a)(2) of the Commission's rules, we are filing with the Commission two copies of this notice in each of the proceedings identified above.

Sincerely.

Kathleen B. Levitz

Vice President - Federal Regulatory

## PRE-ORDERING AND ORDERING OSS

Function:	Average Response Interval for Pre-Ordering and Ordering Legacy Information & OSS
	Interface Availability
Measurement Overview:	As an initial step of establishing service, the customer service agent must establish such basic facts as availability of desired features, likely service delivery intervals, the telephone number to be assigned, product and feature availability, and the validity of the street address. Typically, this type of information is gathered from the supporting OSS's while the customer (or potential customer) is on the telephone with the customer service agent. This information may be gathered via stand-alone pre-order inquiries or as part of the ordering function. Pre-ordering/ordering activities are the first contact that a customer may have with a CLEC. This measure is designed to monitor the time required for the CLEC interface systems to obtain from legacy systems the pre-ordering/ordering information necessary to establish and modify service. This measurement also captures the availability percentages for the BST systems that the CLEC uses during pre-ordering and ordering. Comparison to BST results allow conclusions as to whether an equal opportunity exists for the CLEC to deliver a
	comparable customer experience.
Measurement Methodology:	1. Average Response Interval = Sum [(Date & Time of Legacy Response) - (Date & Time of Request to Legacy)]/(Number of Legacy Requests During the Reporting Period)
	The response interval for retrieving pre-order/order information from a given legacy is determined by summing the response times for all requests (contracts) submitted to the legacy during the reporting period and then dividing by the total number of legacy requests for that day. The response interval starts when the client application (LENS for CLECs; RNS for BST) submits a request to the legacy system and ends when the appropriate response is returned to the client application. The number of legacy accesses during the reporting period that take less than 2.3 seconds and the number that take more than 6 seconds are also captured.
	Definition: Average response time for accessing legacy data associated with appointment scheduling, service & feature availability, address verification, request for Telephone Numbers (TNs), and Customer Service Records (CSRs).
	2. OSS Interface Availability = (Actual Availability)/(Scheduled Availability) X 100
	Definition: Percent of time OSS interface is actually available compared to scheduled availability. Availability percentages for CLEC interface systems and for all legacy systems accessed by them are captured.

Function:	Ordering
Measurement	When a customer calls their service provider, they expect to get information promptly
Overview:	regarding the progress on their order(s). Likewise, when changes must be made, such
	as to the expected delivery date, customers expect that they will be immediately notified
	so that they may modify their own plans. The order status measurements monitor,
	when compared to applicable BST results, that the CLEC has timely access to order
	progress information so that the customer may be updated or notified when changes and
	rescheduling are necessary.
Measurement	1. Firm Order Confirmation Timeliness = \( \sum \) [ (Date and Time of Firm Order
Methodology:	Confirmation) - (Date and Time of Service Request Acknowledgment) ] (Number of
	Service Requests Confirmed in Reporting Period)
	Definition: Interval for Return of a Firm Order Confirmation (FOC Interval) is the
	average response time from receipt of valid service order request to distribution of order
	confirmation. Results are provided based on four (4) hour increments within a 24 hour
	period, along with the percent greater than 24 hours.
	Methodology:
	Non-Mechanized Results are based on actual data from all orders.
	Mechanized Results are based on actual data for all orders from the OSS.      PST and it was a subject to the control of
	BST retail report not applicable.
	2. Reject Interval = ∑ [ (Date and Time of Service Request Rejection) - (Date and Time
	of Service Request Acknowledgment) ] (Number of Service Requests Rejected in
	Reporting Period). Requests are provided based on four (4) hour increments within a
	24 hour period, along with the percent greater than 24 hours.
	- · · · · · · · · · · · · · · · · · ·
	Definition: Reject Interval is the average reject time from receipt of service order
	request to distribution of rejection.
	Methodology:
	Non-Mechanized Results are based on actual data from all orders.
	Mechanized Results are based on actual data for all orders from the OSS.
	BST retail report not applicable.
	3. Percent Rejected Service Requests = \( \sum \) (Total Number of Rejected Service Requests)
	/(Total Number of Service Requests Received) X 100.
	Definitions Bereent Paineted Service Paguests is the assess of setal and assess to
	Definition: Percent Rejected Service Requests is the percent of total orders received rejected due to error or omissions.
	rejected due to error or omissions.
	Methodology:
	Manual tracking for non flow-through service requests
	Mechanized tracking for flow-through service requests
	BST mechanized order tracking.

# Measurement Methodology:

4. Percent Flow-through Service Requests =  $\sum$  (Total of Service Requests that flow-through to the BST OSS) / (Total Number of Service Requests delivered to BST OSS)  $\times$  100.

Definition: Percent Flow-through Service Requests measures the percentage of orders submitted electronically that utilize BSTs' OSS without manual (human) intervention.

#### Methodology:

- Mechanized tracking for flow-through service requests and manual SOER error audit reports (3/31/98). Mechanized tracking for SOER errors and flow-through (4/30/98).
- BST mechanized order tracking.
- 5. Total Service Request Cycle Time = ( $\Sigma$  Date & Time CLEC Service Requests placed in queue for completion) ( $\Sigma$  Date & Time CLEC Service Requests first reaches BST Interface) / Total Number of Service Requests

Definition: The average time it takes to process a CLEC service request, measured from the first time the request reaches the BST interface to the order being placed in queue for completion. Service Request Cycle Time captures both reject and commitment intervals. Results are also provided in four (4) increments within a 24 hour period, along with the percent greater than 24 hours.

#### Methodology:

- · Mechanized tracking for flow-through orders
- 6. Service Requests Submissions per Request =  $\sum$  (Total Service Requests that flow-through to the BST OSS) + (Total Rejects) / (Total Service Requests Received)

Definition: Measures the average number of times the same service request is resubmitted due to changes and/or updates.

#### Methodology:

- Mechanized tracking for flow-through service requests.
- BST retail report not applicable.
- 7. Speed of Answer in Ordering Center =  $\sum$  (Total time in seconds to reach LCSC) / (Total # of Calls) in Reporting Period.

Definition: Measures the average time to reach a BST representative. This can be an important measure of adequacy in a manual environment or even in a mechanized environment where CLEC service representatives have a need to speak with their BST peers.

#### Methodology:

- Mechanized tracking through LCSC Automatic Call Distributor.
- Mechanized tracking through BST retail center support systems.

Measurement Overview:  The "average completion interval" measure monitors the time required by BST to deliver integrated and operable service components requested by the CLEC, regardless of whether resale services or unbundled network elements are employed. When the service delivery interval of BST is measured for comparable services, then conclusions can be drawn regarding whether or not CLECs have a reasonable opportunity to compete for customers. The "order completion interval distribution" measure monitors the reliability of BST commitments with respect to committed due dates to assure that CLECs can reliably quote expected due dates to their retail customer. In addition, when monitored over time, the "average completion interval" and "percent completed on time" may prove useful in detecting developing capacity issues.  Measurement Methodology:  1. Average Completion Interval = [ (Completion Date & Time) - (Order Issue Date & Time) ] / (Count of Orders Completed in Reporting Period)  2. Order Completion Interval Distribution = [ (Service Orders Completed in "X" days) / (Total Service Orders Completed in Reporting Period) X 100  The actual completion interval is determined for each order processed during the reporting period. The completion interval is the elapsed time from BST receipt of a syntactically correct order from the CLEC to BST's return of a valid completion notification to the CLEC. Elapsed time for each order is accumulated for each reporting dimension. The accumulated time for each reporting dimension is then divided by the associated total number of orders completed within the reporting period.  The distribution of completed orders is determined by first counting, for each specified reporting dimension, the total numbers of orders completed within the reporting interval and the interval between the issue date of each order and the completion date. For each reporting dimension, the resulting count of orders completed for each specified time period following the issue date is divided by the tota	Function:	Order Completion Intervals

Function:	Held Orders
Measurement	When delays occur in completing CLEC orders, the average period that CLEC orders
Overview:	are held for BST reasons, pending a delayed completion, should be no worse for the
	CLEC when compared to BST delayed orders.
Measurement	1. Mean Held Order Interval = [ (Reporting Period Close Date - Committed Order Due
Methodology:	Date) / (Number of Orders Pending and Past The Committed Due Date) for all orders
	pending and past the committed due date.
	This metric is computed at the close of each report period. The held order interval is established by first identifying all orders, at the close of the reporting interval, that both have not been reported as "completed" via a valid completion notice and have passed the currently "committed completion date" for the order. For each such order the number of calendar days between the committed completion date and the close of the reporting period is established and represents the held order interval for that particular order. The held order interval is accumulated by the standard groupings, unless otherwise noted, and the reason for the order being held, if identified. The total number of days accumulated in a category is then divided by the number of held orders within the same category to produce the mean held order interval.
	2. Held Order Distribution Intervals
	(# of Orders Held for ≥ 90 days) / (Total # of Orders Pending But Not Completed) X 100.
	(# of Orders Held for ≥ 15 days) / (Total # of Orders Pending But Not Completed) X 100.
	This "percentage orders held" measure is complementary to the held order interval but is designed to reflect orders continuing in a "non-completed" state for an extended period of time. Computation of this metric utilizes a subset of the data accumulated for the "held order interval" measure. All orders, for which the "held order interval" equals or exceeds 90 or 15 days are counted, unless otherwise noted as an exclusion. The total number of pending and past due orders are counted (as was done for the held order interval) and divided into the count of orders held past 90 or 15 days.
	Definition: Average time orders continue in a "non-complete" state for an extended period of time.
	Methodology:
	Mechanized metric from ordering system.
	Transmitted mente nom ordering system.

Function:	Customer Trouble Report Rate
Measurement	This measure can be used to establish that CLECs are not competitively disadvantaged,
Overview:	compared to BST, as a result of experiencing more frequent incidents of trouble reports.
Measurement	1. Customer Trouble Report Rate = (Count of Initial and Repeated Trouble Reports in
Methodology:	the Current Period) / (Number of Service Access Lines in Service at End of the Report
	Period) X 100. Note: Local Interconnection Trunks are reported only as total troubles.
	The frequency of trouble metric is computed by accumulating the total number of maintenance tickets logged by a CLEC (with BST) during the reporting period. The resulting number of tickets is divided by the total number of "service access lines" existing for the CLEC at the end of the report period.
	Definition: Initial and repeated customer direct or referred troubles reported within a calendar month where cause is in the network (not customer premises equipment, inside wire, or carrier equipment) per 100 lines/circuits in service.
	Methodology: Mechanized metric trouble reports and lines in service captured in maintenance database(s).

Function:	Missed Repair Appointments
Measurement Overview:	When this measure is collected for BST and CLEC and then compared, it can be used to establish that CLECs are receiving equally reliable (as compared to BST operations) estimates of the time required to complete service repairs.
Measurement Methodology:	2. Percentage of Missed Repair Appointments = (Count of Customer Troubles Not Resolved by the Quoted Resolution Time and Date) / (Count of Customer Trouble Tickets Closed) X 100.
	Definition: Percent of trouble reports not cleared by date and time committed.  Appointment intervals vary with force availability in the POTS environment. Specials and Trunk intervals are standard interval appointments of no greater than 24 hours.  Methodology: Mechanized metric from maintenance database(s).
